Group

- This list is used to select the current group of bundled animations
- The filetypes listed below contain multiple sets of bundled animations
 - EMD
 - RDT
- Each group will have a varying amount of individual animations
- The option to add/delete groups is currently unavailable

Animation

- This list is used to select the current animation
- To create a new animation, press the “+” button beside the animation list
- To delete an animation, select the animation you wish to delete and press the “-” button beside the animation list

Type

- This list is used to select the model or animation type to be viewed or modified
- The game associated with the filetype will be listed to the right of the list
 - Only BH2/RE2 filetypes are currently supported

Skeleton

- This list is used to select the current model joint (objects)
- Joint base positions can be modified using the X/Y/Z edit boxes in the “Skeleton” group box
 - These values effect every frame of every animation
- Individual joints can be highlighted by selecting the “Highlight” checkbox
 - Highlighted joints will be drawn as either wireframe or flat vertices
- Individual joints can be named using the “Name” edit box
 - Names are capped at 16 characters
 - Names are temporary and lost when the model or app is closed
- The option to add/delete joints is currently unavailable

Armature

- This list is used to select bones (objects) linked to the currently selected **Joint**
- The current bone will be listed in an edit box beside the Armature list
- The option to add/delete bones is currently unavailable

Frames

- The Origin, Speed, Rotation X/Y/Z values, Speed and Sound flags for individual frames of an animation can be modified in the “Frames” group box
- Pro-Tip: Remember to set every Joint Rotation of every Frame – use the Joint list
- To create a new frame, press the “New” button in the “Frames” group box
- To delete an animation, select the animation you wish to delete and press the “Delete” button in the “Frames” group box
- To copy a frame, select the frame you wish to copy and press the “Copy” button in the “Frames” group box
- To paste a frame, select the frame that you wish to overwrite and press the “Paste” button the “Frames” group box

Model

- To open a model, press the “Open” button
 - Supported games are: BH2/RE2, BH2 (Nov '96 prototype)
 - Supported filetypes are: PLD, EMD, PLW and MD1
 - Check the “Nov '96” button before opening a Nov '96 prototype EMD
- To save a model, select a “Type” and press the “Save” button
 - This option will create a new PLD/EMD/PLW
 - The previously opened PLD/EMD/PLW will not be overwritten
 - The new model will be in a new folder in the same directory of the previously opened PLD/EMD/PLW of the same name
 - No new data will be created if there isn't any open data for “Type”
- To close a model, select a “Type” and press the “Close” button
 - This option does not work with RDT data; close the RDT instead
- To disassemble a model, press the “Disassemble” button
 - Supported games are: BH2/RE2, BH2 (Nov '96 prototype)
 - Supported filetypes are: PLD, EMD, PLW and MD1
 - This option does not open the model for editing
 - The option extracts the contents of the model file to a newly created folder for manual modification
- To assemble a model that has been disassembled using the “Disassemble” function, press the “Assemble” button
 - You will be prompted to look for an INI file (PL00.INI, for example)
 - This option does not open the model for editing
 - EDD and EMR files are not used for compilation

Playback

- To play an animation, press the “Play” button
 - The “Play” button will automatically become the “Stop” button after being pressed
- To loop playback, select the “Loop” checkbox
 - The “Loop” checkbox is off by default
- To adjust the frame delay, use the edit box beside the “Delay” text
 - This value is always 30 by default
 - Animations are hardcoded at 30 fps – playback at this value to see how the animation will appear in-game
 - Lowering this value will speed up the animation, raising it has the opposite effect
 - This value does not directly affect animation in any way

EMD

- If the “Use w/ SCD” option is selected, the EMD position and rotation will be automatically set to the currently selected “Sce_em_set” position and rotation when using the Script Editor
 - EMD must be open (can be opened at any time)
- If the “Use w/RDT” option is selected, EMD will be used with RDT animations; otherwise, PLD will be used by default
 - EMD must be open (can be opened at any time)
 - The RDT must contain animation data

Model

- To view the model in a special camera view, select the “Editor” checkbox
- The world position and rotation of the selection model can be set using the “Pos” and “Rot” edit boxes in the “Model” group box
 - These values do not directly affect the animation data in any way and are not saved
- The viewport color can be modified by adjusting the R, G and B values
 - These values are saved to the app’s configuration and set on boot

TODO

- Add “Help Tips” (using the “?” button)
- Ability to create animations from scratch – can currently only do so using existing data
 - Ability to add/delete animation **Groups**
 - Ability to add/delete **Joints** and **Armature**
- Euler modifier for **Joint Rotations** – simple X/Y/Z coordinate modification isn’t enough
- Ability to add/delete/replace individual model objects
- Camera modifier in “Model View” mode
- Texture Mapper
- Support for BH2/RE2 models with BIN data
- Support for BH1/RE1 and BH3/RE3 models

BUGS

- Most likely
- Please provide any feedback, suggestions and criticism
